Example: Siemens EP 2007
Explanation: Smart Search will look for Siemens as being the inventor/applicant (first letter in uppercase), for all EP, i.e., European patent applications (2 letters in uppercase for the country code) and 2007 as publication date (4 digits for the year of publication).
Improvements to espatenet
A number of important new features and functions have been added to espatenet in an upgrade in January. These included improved navigation within help files, a default search options setting to the Worldwide database and display of the A0 document, instead of the corresponding PCT document, for Euro-PCT publications.
Major new items are:
full-text search in EP and WO in all three official languages highlighting of searched terms even in the full text a sort function for all lists improved pagination and navigation within lists. espatenet also became more graphic, displaying a first set of embedded images within Classification search. You can analyse the patent claims as filed and visualise the independent and dependent claims. espatenet will display all backward and forward citations, including documents cited in search, examination, opposition, appeal, etc. You will also be able to enter more search terms in any one field, and the search boxes themselves expand to accommodate this. Finally, the SmartSearch field identifiers have been refined.

The radiator has a number of radiator elements (10), each provided by a pair of profiled sheet stell half shells which are welded together to define a hollow space (3) with at least 3 channel zones (31, 31', 31''), for reception and circulation of the heating oil. All the outer edge zones (201, 202, 203) of each radiator element which can come into direct physical contact with a person during operation of the radiator, are free of the heating oil, the radiator elements having a width (B) which is double that of normal radiator elements.

(57)Abstract:
PROBLEM TO BE SOLVED: To provide a variable displacement compressor which does not generate axial vibration of a driving shaft even when the compressor is operated under a low thermal load condition.
SOLUTION: In this variable displacement compressor 1' which controls the tilt angle of a swash plate 20 rotating in synchronism with a driving shaft 11 by the inner pressure of a crankcase 10 to control the stroke of a piston 24, and to variably control the compressive capacity, the driving shaft 11 is rotatably supported by a radial bearing 13 inserted into the center bore 8 of a cylinder block 6 having plural cylinder bores 7, and one end of the driving shaft is axially supported by a thrust bearing 14 screwed into the center bore. An axial clearance of the thrust bearing is adjusted by an adjusting screw 15', and a Belleville spring 33 is interposed between the thrust bearing and the adjusting screw 15'.</p> |

CLAIMS

[Claim(s)]
[Claim 1] A cylinder block which has two or more cylinder bores and center boas.
A driving shaft which it extended in a crankcase contiguous to a cylinder block, and an end was inserted in a center boa, and was supported pivotable by a cylinder block via a radial bearing.
A stretching screw which screw in a center boa, and an end of a driving shaft is supported to shaft orientations via thrust bearing, and adjusts axial clearance of thrust bearing.
A cam plate which an angle of inclination to a driving shaft is variable, and was connected with a driving shaft so that it might rotate synchronizing with a driving shaft.
It is attached to the end face of a cylinder block via a plate.
